

WATER DISPENSER

The water dispenser automatically dispenses the 2000g of water needed to be added to the cane sample, for homogenisation in the Cold Digester.

It requires a 220V supply, a water mains connection and a connection to a drain.

It comprises a water inlet and outlet valve, a control box and an adjustable probe to adjust the amount of water in the reservoir.

It is mounted on a water proof melamine box that can accommodate the top loading balance used to measure the cane for digestion.
